

Innovative Robust Reliable

**quality assays for fresh
plant products**

VaseNSure Carnation

An important quality aspect for carnation is the remaining number of vase life days. In trade decisions concerning market choice or timing of sales this criterium is crucial. The VaseNSure assay for carnation enables an accurate estimation of the quality of the batch. This provides the certainty that important customers will receive the top quality that you want to deliver. It ensures that an exported batch will arrive at the foreign retailer's shop with sufficient remaining vase life. Alternatively, the test can be applied to monitor directly the effect of changes in culture methods or post harvest treatments.

The VaseNSure assay directly measures the biological processes involved in flower quality. The do-it-yourself-sampling kit guides you through the sampling procedure and the sample card is sent to one of NSure's test laboratories for analysis. Within two working days you will receive the result - a classification in one of the quality categories 'moderate', 'medium' or 'top'.

The VaseNSure Carnation assay is in the introduction stage. This means that we are still in the process of expanding our reference database, which will further improve the predictive value of the test. In this introduction period we offer the assay with a 30% discount!
